

Day 8 – Assignment

This task helps you become familiar with the fundamentals of PHP by writing PHP script to enhance a web site.

Due

This assignment does not need to be handed in. Your instructor will review it the next morning so you can ask questions and get assistance with any problems you may encounter. You will build onto this assignment in the remaining assignments of this course. If you want feedback on your code you can ask your instructor to check it and give advice. You will be required to hand in the cumulative code after day 14 for marking. Your instructor will set the due date for you.

Directions

In this exercise you will enhance the web pages you built during the HTML and JavaScript sections of the course to provide server-side processing.

1. Rename your index.html, register.html, and contact.html to have a “.php” extension. Change any references inside the files to use the new names.
2. Create a new page named links.php and add a link to your index page that points to it.
3. In the links page, use a php loop to generate an HTML table. Write a table tag and loop 6 times, writing a table row with 2 table cells each time you pass through the loop. After 6 rows have been written, close the table tag.
4. As you write each row, write the row number in the first cell (you can use the loop counter value for this if you start at 1). In the second cell write an anchor tag. Set the href attribute value by generating a numbered name for the HTML page it points to (ie. page1.php, page2.php, etc.). Create dummy pages for page1.php through page6.php so you can test the links.

Feedback:

Your instructor will review this exercise with you the next day.

If you have any questions or wish to get some feedback on your work before the hand-in date, ask your instructor to review it with you after class.
